Risk	Statement	Response	Objective	Likelihood	Impact
User accidentally enters the wrong ID to delete	User might accidentally enter the wrong ID of the record they wanted to delete	Display a confirmation message to let the user confirm about the operation they want to do	Let the users be aware of the action they're about to perform	Expected	Major
User enters case insensitive commands	User may enter commands that may or may not be Capital letters	Switch statements checking for the lowercase version of user inputs to neglect the case	To let users not worry about entering capital letters or not	Expected	Major
User performs operations on an empty database	User might want to go straight to performing some operations without realizing they odn't have that information they wanted to work with	In every operation, show the users the data available for them to work with	Not only will this allow the user to jump straight to the operation they want to do but it'll also let them aware of the data that they currently have access to	Likely	Moderate
User forgets the ID of the entity they wanted to interact with	User might want to create an order and forgets the ID of the customer they want to create an order for or the item they want to order	Display existing customers data as well as items data	This will allow the users to have that reference on IDs without having to go back to Customer or Item categories	Likely	Minor
